Soil Amendment is a key element of our sustainable growing system for greenhouse/warehouse growers. SA is another of our patented, one-of-a-kind technologies. It dramatically enhances nutrition, minerals, and moisture retention in growing media and efficient uptake by plants. A benefit is the plant may need less fertilizer and moisture than in the past to do its job. The reduction of fertilizer use means no return to clogged soils, less chemical runoff into water sources and reduced exposure to health hazards from chemical residuals.
