

Alfalfa Success Story

First Use - Spring 2015

On 04-27-15 a many generation West Texas farmer, Don Y. bought SoilClean™ for his 180 acres of Alfalfa. He sounded depressed. His alfalfa was in such poor condition, he was considering plowing it under. I suggested applying 5 oz. per acre. (\$5 per acre or \$900 for 180 acres) He did with 15 gallons of water per acre. On 06-11-15 he was excited again. He reported the best and most improved alfalfa crop he had ever had, especially since he had considered plowing it under. He applied three additional sprays at seven-day intervals, beginning seven days after the first cutting at the rate of 5oz. per acre and 15 gallons of water. He also applied his Micro-nutrient/Macro-nutrient at the rate of 16 ounces per acre. Total seasonal investment per acre: \$20 or \$3,600 for entire season. On 08-24-15 Don conducted his fourth cutting saying it is much better than normal. He baled an additional 460 bales. He found no worms or insects in the Alfalfa. The 4th cutting was all unexpected profit: 180 acres x 40 bales per acre @ \$8.00 per bale = \$320/acre or \$57,600 less \$900 Soil

Amendment = \$56,700.00 extra profits! The farmer credits SoilClean™ with saving his farm showing why GreenSafe products are an investment, not a cost.

Today

Don has spoken on several occasions during 2017 and 2018 talked about his years using SoilClean™. He says it lets him cut back on both fertilizer and herbicide. And he saves application time because his nozzles no longer plug. And he's finding new applications. He says he's getting great results applying it on black eyed peas and his trees. Don reports he has a horse breeder who says she won't buy alfalfa from anyone else. She credits there being no worm castings or insect debris with her much lower veterinarian bills. Don says he's noticed he doesn't see insects flying up when he's cutting.

How GreenSafe Works

GreenSafe products enable plants to attract, hold and exchange positively charged particles of magnesium, calcium, carbon, trace minerals and other nutrients in a manner that allows roots to more easily absorb them. This occurs because GreenSafe stimulates electro-magnetic activity in the roots. (Cation Exchange Capacity or CEC) Through this process GreenSafe stimulates natural growth of plants at the cellular level. This encourages increased root size for more efficient uptake of nutrients and moisture to improve stamina in the plant. GreenSafe gives the plant a useful source of natural plant growth stimulators and amino acids. The growth stimulators include naturally occurring levels of auxin, gibberellin and cytokinin plant hormones which are used by the plant to regulate plant growth, cell division in roots and shoots. GreenSafe is effective with hydroponics, greenhouse growing and traditional gardening. Hydroponic growers must reduce inorganic nutrients by one third to avoid overfeeding.
