

## Biostimulant Value

Don Y. bought BioWash Soil Amendment (SA) for his 180 acres of alfalfa. His alfalfa was in such poor condition, he was considering plowing it under. He applied 5 oz. per acre (\$5 per acre or \$900 for 180 acres) with 15 gallons of water. He reported the best and most improved alfalfa crop he had ever had, especially since he had considered plowing it under. He applied three additional sprays at seven-day intervals, beginning seven days after the first cutting. He also applied his micro-nutrient/macro-nutrient at the rate of 16 ounces per acre. Total seasonal investment per acre was \$20 or \$3,600 for entire farm. Don conducted his fourth cutting saying it was much better than normal. He baled an additional 460 bales. He found no worms or insects in the alfalfa. The 4th cutting was all unexpected profit: 180 acres x 40 bales per acre @ \$8.00 per bale = \$320/acre or \$57,600 less \$900 for Soil Amendment = \$56,700.00 extra profit! Don credits SA with saving his farm showing why Green-Safe-Solutions' products are an investment, not a cost. Four sprays over a growing season costs \$100.00. The benefits can result in income as much as ten times cost. The benefits of this non-toxic, 100% biodegradable cost-effective technology are:

- When sprayed on young crops, it immediately penetrates the leaves and serves to improve the efficiency and efficacy of photosynthesis.
- It is not a nutrient, but it substantially increases yields and quality of produce; it drives the roots deeper and broader where they attract more moisture and nutrients.
- It is not a chemical insecticide, but because it increases the BRIX (sugar) levels of plants, many farmers report that harmful, soft bodied insects are kept away so that they no longer need to use expensive chemical insecticides.
- Farmers also report that the product controls many fungi and other crop diseases.
- SA cleans spray systems, then keeps them clean. No time is lost clearing plugged sprays.

## How It Works

Natural plants and synthetic fertilizers are incompatible.. It is difficult for plants to absorb essential nutrients, water and oxygen. SA application reduces the cost of fertilizers and their by corrected the solubility issue. Unbound nutrients may eliminate need for new fertilizer applications the first season. 30-50% improved plant uptake will reduce both nutrients and water requirements. SA contains a wide selection of plant sourced chelators. Chelation is a process of dissolving metal and/or synthetic ions. Chelating agents dissolve relatively insoluble iron and other mineral nutrients, making them more absorbable for plants. SA is an exceptionally effective cation exchange stimulant.

**Give your combine  
a real workout this fall.**

Discover how BioWash® Foliar fertilizer booster can help you cut nitrogen rates and still harvest higher yields.

By unlocking the nutrients in your soil, BioWash Foliar is the only fertilizer booster that offers you all these key benefits in one affordable and easy-to-use product:

- Yield increases of 30% to 70% in corn, soybeans, alfalfa and wheat
- The ability to cut nitrogen rates without negatively impacting crop yields
- Greater root mass for enhanced nutrient uptake
- Improved stalk strength for less lodging and easier combining

- Proven protection against frost and freeze damage, drought and other weather extremes
- A 100% non-toxic, carcinogen-free and biodegradable product
- All for less than \$7 per acre!

To learn how you can have your combine working overtime this fall, visit [www.biowash.info](http://www.biowash.info) or call 239.465.1890.
